Auto Stream Info v4.34

Customer Setup Guide - Made by C4TM30W

Website: c4tm30w.stream Contact: contact@c4tm30w.stream

What it does

Detects the game running on the Windows PC, resolves the official stream category, creates game-specific tags and hashtags, and guarantees that the detected game appears in the final title.

Requirements

Windows 10/11, Streamer.bot 1.0.x, OBS Studio or another program supporting custom browser docks, and the customer's own connected streaming account.

Install

1. Extract the ZIP fully.
2. Run REGISTER_CURRENT_FOLDER.bat or INSTALL_TO_CHOSEN_FOLDER.bat.
3. Run VERIFY_INSTALLATION.bat.
4. Copy StreamerBot_1.0/IMPORT_STRING_PASTE_IN_STREAMERBOT_IMPORT.txt into Streamer.bot -> Import.
5. Enable Streamer.bot WebSocket Server, normally 127.0.0.1:8080.
6. Add Docks/Auto_Stream_Info_Dock.html through OBS -> Docks -> Custom Browser Docks.
7. Connect, click Check Actions and confirm all 13 actions are found.

TXT files: Import versus C#

IMPORT_STRING_PASTE_IN_STREAMERBOT_IMPORT.txt goes into the Streamer.bot Import window. Files containing **COPY_PASTE** are manual repair source and go into Core -> C# -> Execute C# Code. README and configuration TXT files are never imported.

Automatic game detection

Each scan creates a unique probe ID. The detector checks Windows processes, executable mappings, installation paths and the foreground window. It writes the result to persisted Streamer.bot globals. The dock reads the complete GetGlobals snapshot and accepts only the result whose probe ID matches the current request. This prevents an old Twitch category or manual value from being reused as local detection.

Signal	Purpose
Known executable	Most reliable match, for example cs2.exe or ShooterGame_BE.exe
Install path	Recognizes games installed through Steam/Epic/GOG/Xbox and similar folders
Foreground process/window	Fallback for games not yet mapped
Twitch category	Official destination/category confirmation, not proof of the running PC game

The game in the title

The final title always includes the detected game. The title may use a compact label such as CS2 while the category is sent using the official platform category name.

Customer customization

The customer enters their own channel name, languages, identity/VTuber setting, title voice, required terms, optional promo switches and optional Discord webhook. No seller credentials are included.

First test

1. Start a game and leave Manual Game empty.
2. Click AUTO SCAN + SEND GAME/TAGS NOW.
3. Confirm the game/category and discovery data.
4. Confirm the title contains the game.
5. Close it, open another game and scan again.
6. Confirm the old game is not reused.

Troubleshooting

If no game is found, open Logs/last_game_detector_report.txt. Add the exact executable under [KNOWN_GAMES] in Config/auto_stream_info.rules.txt. If actions are missing, the dock is connected to a different Streamer.bot instance/port or the import was not performed in that instance.
